Accessibility, Mobility and transportation: the new challenges of integrated management and sustainability

Coordination

Jorge Batista e Silva (IST); Nuno Costa (IGOT); David Vale (FA)

In this workshop, we will explore the multimodal connections of the city, visiting the two banks, and all done by public transport which represents a huge effort for central government and society that started in 1966 with the first bridge.

This workshop will start and end by the most important travel mode: walking! The workshop will start at IST, and we will visit the neighborhood Arco do Cego and the Saldanha area, in which several traffic calming and urban design projects have been recently made in order to increase the walkability of this area.

We will then take the metro to Parque das Nações, the better example of a TOD in Lisbon, created for the Expo98 and nowadays a major centrality of the city.

Afterwards, we will take a train across the Tagus River, through the 25 of April Bridge, which will take us to the south bank where we can see a suburban multimodal station and a light rail transport system recently put in place and articulated with rail system. From there we will take this tram to Cacilhas, the major ferryboat station of the south bank, in which we can enjoy great views of the city of Lisbon.

From there, we will take the ferryboat to Cais do Sodré, one of the first multimodal places of the city, right in the city center. From Cais do Sodré, we will walk to Largo Camões and then take the pedestrian route that connects two major hills of Lisbon, which will allow us to use the Santa Justa Lift, one of the oldest lifts of the city, operating since 1902.

The trip will allow us to discuss important issues such as the last 50 years evolution and the transport policy of the last 20 years, the efforts made to promote TOD and to integrate land use planning with transport planning. Please bring comfortable shoes and a hat!

Duration: 4 hours

Difficulty: medium

Transport: subway, train, ferry and bus for specific connections between locations
